the plant group group group and seems group to the seems of the seems

1. A system for measuring a property of a liquid, comprising: a piezoelectric sensor device which is completely immersed in the liquid to be measured, the sensor including:

electric contact points for an electric control and which are resistant to the liquid;

electric lead conductors which are resistant to the liquid and which are connectable to an electronic control/analyzer unit arranged outside the liquid; and

a switable conductive adhesive containing metal particles and for coupling the electric lead conductors to the electric contact points.

- The system of claim 1, wherein viscosity is the property of the liquid that is measured.
- 3. The system of claim 1, wherein the piezoelectric sensor device is configured as a disk-shaped quartz crystal and is excitable to shearing oscillations by the electric control.
- 4. The system of claim 1, wherein the liquid to be measured is an oil.
- 5. The system of claim 1, wherein the electric contact points are one of gold and chromium electrodes.
- 6. The system of claim 1, wherein the electric lead conductors are one of gold-plated wires and chromium-plated wires.
- 7. The system of claim 1, wherein the electric lead conductors are configured as bifurcated contact springs.
- 8. The system of claim 1, further comprising:

a protective container having a bottom and a cap, the protective container enclosing the piezoelectric sensor device and being able to be introduced into the liquid.

9. The system of claim 8, further comprising:

bushings situated in at least one of the cap and the bottom of the protective container,

wherein the electric lead conductors are led through the protective container through the bushings.

- 10. The system of claim 9, wherein the bushings are made of glass.
- 11. The system of claim &, further comprising:

connecting leads in at least one of the cap and the bottom of the protective container,

wherein the electric lead conductors are connectable to the connecting leads.

- 12. The system of claim 8, wherein the protective container includes at least one opening for a liquid inlet/outlet.
- 13. The system of claim 12, wherein the at least one opening is situated in the cap of the protective container.
- 14. The system of claim 8, wherein the protective container is hermetically sealable.
- 15. The system of claim 1, wherein the conductive adhesive is an isotropic, electrically conductive adhesive including at least one of an epoxy resin, a phenolic resin, and a polyimide.
- 16. The system of claim 1, wherein the conductive adhesive is an isotropic, electrically conductive adhesive including an epoxy-phenol.
- 17. The system of claim 1, wherein the metal particles in the conductive adhesive are at least one of nickel particles and gold particles.

4.3

the Party affects affects

- 18. The system of claim 17, wherein the at least one of nickel particles and gold particles have a particle size of approximately 2 μm to 20 μm .
- 19. The system according to claims 17, wherein the at least one of nickel particles and gold particles are provided in the conductive adhesive in a concentration of 75 to 95 wt%.
